

# FLAME RETARDANT RUBBER SPRING ROLLER

**CERTIFIED ACCORDING TO  
TSI WAG (ISO 5660 -1: 2015)**

The rubber roller spring can be used in bogies both as primary or as secondary suspension. By using the rubber roller spring suspension for freight wagons, the driving behaviour - even in unfavourable conditions with track defects- is improved and the noise is reduced. By the 3-dimensional design of the suspension the force level for keeping the track is reduced and thus a lower wear level is achieved.

Rex Articoli Tecnici has been around for many years as a producer of rubber roller springs and is recognized as certified supplier to the railways in Switzerland, Austria and Germany. Also well-known manufacturers of bogies belong to our customers.

Rex Articoli Tecnici has developed a new compound for the rubber roller springs which meets the dynamic and mechanical properties and complies with the TSI WAG (ISO 5660 -1: 2015) for flame retardant applications.

**The Material is now exclusive available at  
Rex Articoli Tecnici.**
