

# CELLULAR RUBBER

CERTIFIED ACCORDING TO  
UNI CE EN 45545 HL 1 – 3 / R22 & R23

Cellular rubber (sponge) is a common and widely used sealing material. It is excellent for sealing of components that have high Tolerances. Due to the foam-like consistency, the material is very compressible and retains a very good Compression set (CS).

The Material is used in different thickness in flat, 2-dimensional applications. It is also possible to apply a self-adhesive film. Therefore, the cellular rubber could be used as aid during the montage.

The newly developed cellular rubber material has a flame-retardant rubber- compound as base, which offers very good mechanical

properties and dynamic properties.

Now the new material is certified according to UNI CE EN 45545 HL1 - HL3 for applications under R22 and R 23.

**The cellular rubber is available exclusively by Rex Articoli Tecnici.**
